

# Norman's Whereabouts

by Norman Searah

June 2007

**H**ello! Ever since I saw Al Gore's movie, "An Inconvenient Truth" about global warming, I've been watching other movies about global warming, like Tom Brokaw's, the newsman that retired from TV movie on global warming and the global warming movie from NASA, the people that send people and other things into space. I've seen about movies about global warming but they were mostly for entertainment.

But I really want to see, if the military has a movie on what war has contribute to global warming. I often think about our world at the same time I'm thinking about my own health, my body like everyone else does or I guess everyone does? And I wonder if war does damage to the earth, along with other things like people. And if war does damage the earth, than we need to change not some of us, but all of us and we need talk, even if it means

learning other languages. Maybe we need to start by getting to know our neighbors, the people and animals who live around us, after all it is their world too.

In the movie The Day After, the northern Hemisphere of the earth is covered with snow. I figure by the snow in the move it must be a new Ice age, it covered most of all the industrial nations because they are in the north. But the interesting thing in the movie to me was when the president dies leaving the vice president in charge, he orders the evacuation of the USA and apologies to the people in the southern Hemisphere for all the wrong the USA did to t he people in South America.

I find it an interesting thing if you were to look around; you probably find a lot of people from other nations living in the USA. You don't have to go to New York City. These people come to better their lives and I can't blame them. Can you? We need to share, like children in a sand box, in fact no matter how old we are, we're still playing in the sand back called

Earth.

We do a lot of damage to the Earth, our human home, even though its done so much good for us and than we pass the mess on to the next generation and tell them that this will be theirs some day. And when their old they can pass it on too. It seems to me we are passing on to the next generation our mess, things that they can't get rid of like nuclear waste.

We have to stop and figure out how to undo the wrong and correct it. Not latter, but now because later might be too late. Because in Al Gore's movie they figure that the North Pole and the South Pole will melt in fifty years. I think they will melt sooner and we are not ready to move into a mad made biosphere or some kind of geodesic dome, city in glass. We all got to start to fix out human home and we can start by being honest to each other about the problem and work together by sharing.

In my early years I received a book by Buckminster Fuller from a friend who knows that

Buckminster Fuller was one of the people I honored. He is known for inventing the Geodesic Dome. But he was much more. He had a lot of respect for humanity. He believed the world can be made to work for all people. I do too. But we must care for our home, the Earth. A lot of people I know (not personally) some famous and some not famous have talked and written about the care of the Earth. If we are to pass it on than we should pass it on in better shape than it was passed on to us.

I thank you always
